

Effective management of 7,000 small SKUs

MEQUISA, a wholesaler specialising in bathrooms, flooring, HVAC and electrical solutions, modernises its logistics processes with automated and conventional systems.

Country: **France** | Sector: **decoration & household**

MEQUISA is a wholesaler specialising in four divisions: bathrooms, flooring, HVAC and electrical. The company markets a wide variety of SKUs, such as lamps, taps, showers, bathtubs, radiators, boilers, photovoltaic panels, light bulbs and tools, among others.

- » **Founded in: 1934**
- » **No. of employees: 210**
- » **Points of sale: 11**
- » **Showrooms: 10**

CHALLENGES

- Replace multi-tier shelving with a system that **maximises space utilisation**.
- **Streamline the preparation of orders** with high-turnover products.
- **Control the traceability** of small items in real time.

SOLUTIONS

- **Miniload system.**
- **Mecalux's Easy WMS warehouse management software.**
- **Carton live storage** with a put-to-light system.
- **Pallet racking.**
- **Cantilever racking.**

BENEFITS

- **Automated storage of 7,412 boxes** in just 200 m² of floor space.
- **Increased speed and fewer errors in order picking** with the put-to-light system managed by Easy WMS.
- Full traceability of **7,000 SKUs**.

MEQUISA is a wholesaler specialising in bathroom solutions, including flooring; electrical; and heating, ventilation, and air conditioning (HVAC). It set out to optimise logistics operations in its facility in Metz (France), with a special emphasis on fine-tuning inventory management and order picking.

In the past, the company stored its small products on multi-tier shelving and its larger items on pallet racking. Over time, MEQUISA's supply chain became overwhelmed by the increase in activity. This motivated the company to launch a modernisation and expansion project with the help of Mecalux.

MEQUISA's new warehouse had to be automated for several reasons: to scale up throughput, optimise the storage capacity of small items and improve working conditions for operators in order picking.

To replace the multi-tier shelving, Mecalux installed a miniload system. This automated storage and retrieval system (AS/RS) for boxes boosts goods receipt and order picking through the non-stop flow enabled by the handling equipment and two pick stations. "Undoubtedly, investing in a miniload is a guarantee for improving and optimising customer service," says José Esteves, CEO of MEQUISA.

Easy WMS, the warehouse management system from Mecalux, supervises all operations in the AS/RS for boxes. The program serves a dual function: to update inventory in real time and guide operators in order picking.

With various storage systems under one roof, the company can distribute goods based on their characteristics and turnover. Thus, for example, smaller and high-turnover products are placed in the miniload system to streamline their entries and exits. Larger merchandise, meanwhile, is stored on pallet racking.

Automatic throughput in a minimal space

"With Mecalux's AS/RS for boxes, we've considerably cut order picking times. Operators no longer have to travel from floor to floor in our centre, which accounted for more than 40% of their working day. We've allocated the time saved to tightening quality control during the goods receipt and dispatch processes," says Esteves.

The miniload system consists of a single 45-metre-long aisle with double-deep racking on both sides. In just 200 m² of floor space, MEQUISA can store 7,000 SKUs and up to 7,412 boxes.

A stacker crane equipped with telescopic forks handles up to four totes simultaneously to streamline their storage and retrieval in the racking. The AS/RS was designed in line with MEQUISA's growth prospects. Therefore, when the company needs to double its productivity, another storage aisle can be set up without halting the facility's operation.

Two pick stations have been installed in front of the miniload system. There, workers prepare up to 30 orders at a time according

“The miniload AS/RS helps us cut the time needed to fill orders. The automation and put-to-light system, directed by Easy WMS, have raised the quality of order picking, minimising errors due to manual management. Undoubtedly, investing in an AS/RS for boxes is a guarantee for improving and optimising customer service.”

José Esteves
CEO, MEQUISA

to the goods-to-person method. These operators remain at their workstations as the products are brought to them. They then sort the items in the carton live storage located behind them. This system stands 2.2 m tall and is made up of slightly inclined roller platforms. Hence, once an order is closed, it slides by gravity to the dispatch area on the opposite side.

Integrated into the carton live storage, put-to-light displays guide operators to improve their performance as they sort goods and put together orders, ensuring ergonomic, accurate and reliable picking.

MEQUISA's put-to-light system is connected to the Easy WMS warehouse management software. Via the put-to-light displays, Easy WMS shows the operators which box to deposit the products in and the exact number of units required. The program strictly controls the goods thanks to its permanent two-way connection with MEQUISA's AS400 ERP system.

Easy WMS organises the stock and decides on a location for each item using rules and algorithms that take into account their characteristics and demand level. The distribution of the products is designed to optimise the movements of the stacker crane while maintaining the flow of goods that MEQUISA requires.

"The automation and put-to-light system, directed by Easy WMS, have raised the quality of order picking, minimising errors due to manual management," says Esteves.

Storage of bulky products

The AS/RS is complemented with a storage area reserved for palletised products with a capacity for 6,432 pallets containing ceramic tiles. MEQUISA chose adjustable pallet racking because of its versatility, as it can be adapted to different unit load sizes.

Pallet racks also offer direct access to products. This makes goods management extremely agile and fosters strict product control, as each location is assigned to a specific SKU.

In most of the lower racking levels, operators pick directly from pallets. Safety stock and shipping materials (e.g., cardboard

boxes) are placed on the upper storage levels.

Integrated logistics solution

The AS/RS for boxes is a major step forward for MEQUISA: in addition to housing 7,000 SKUs in a limited space of 200 m², it has boosted productivity in order picking. The system is prepared to drive the company's growth in the years to come: MEQUISA will have the option to install another stacker crane to double its warehouse throughput.

The digitalisation enabled by the Easy WMS software provides rigorous control of the goods and sends instructions to operators on how to fulfil orders more quickly. The combination of an AS/RS, carton live storage and Easy WMS has streamlined the simultaneous preparation of multiple orders, greatly reducing the likelihood of errors. MEQUISA's end goal? To offer its customers quality service.

Advantages of put-to-light systems

- » **Productivity.** They cut down on operator travel and eliminate the need to read barcodes.
- » **Error reduction.** Product verification is immediate, with an order accuracy rate of over 99.5%.
- » **Real-time updating.** These systems update inventory information instantly by transmitting stock movements to the software, which records them in the database.
- » **User-friendliness.** This order picking technology is very intuitive and easy to use, requiring no prior training.
